

**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A manufacturing method of a display device comprising:  
~~forming a plurality of display devices over a substrate to be processed~~  
forming a first display device pattern and a first wiring pattern over a substrate by  
exposing the substrate to light through a reticle;  
forming a second display device pattern and a second wiring pattern over the substrate  
by exposing the substrate to light through the same reticle, thereby  
forming a wiring by electrically connecting the first wiring pattern and the second  
wiring pattern,  
~~forming a wherein the wiring led out from a signal input terminal of each display~~  
~~device the first display device pattern and the second display device pattern to the an edge of~~  
~~the substrate to be processed; and~~  
~~wherein the wiring is formed by exposing to light through a repetitive pattern~~  
~~including a wiring pattern integrated with a display device pattern; and~~  
separating the plurality of display devices into individual display devices.

2. (Original) A manufacturing method of a display device according to claim 1,  
wherein the display device includes a plurality of TFTs.

3. (Original) A manufacturing method of a display device comprising:  
forming a plurality of display devices over a substrate to be processed;  
forming a wiring led out from a signal input terminal of each display device on the  
edge of the substrate to be processed;  
bringing a detachable and conductive component into contact with the wiring on the  
edge of the substrate to be processed;  
detaching the conductive component from the wiring; and  
separating the plurality of display devices into individual display devices.

4. (Original) A manufacturing method of a display device according to claim 3,

wherein the conductive component makes signal input terminals of the display devices short circuited to each other by having contact with the wiring on the edge of the substrate to be processed.

5. (Original) A manufacturing method of a display device according to claim 3, wherein the display device includes a plurality of TFTs.

6. (Original) A manufacturing method of a display device comprising:  
forming a plurality of display devices over a substrate to be processed;  
forming a wiring led out from a signal input terminal of each display device to the edge of the substrate to be processed,

wherein the wiring is formed by exposing to light through a repetitive pattern including a wiring pattern integrated with a display device pattern;

bringing a detachable and conductive component into contact with the wiring on the edge of the substrate to be processed;

detaching the conductive component from the wiring; and

separating the plurality of display devices into individual display devices.

7. (Original) A manufacturing method of a display device according to claim 6, wherein the conductive component makes signal input terminals of the display devices short circuited to each other by having contact with the wiring on the edge of the substrate to be processed.

8. (Original) A manufacturing method of a display device according to claim 6, wherein the display device includes a plurality of TFTs.

9. (New) A manufacturing method of a display device comprising:

forming a first display device pattern and a first wiring pattern over a substrate by exposing the substrate to light through a reticle;

forming a second display device pattern and a second wiring pattern over the substrate by exposing the substrate to light through the same reticle, thereby

forming a wiring by electrically connecting the first wiring pattern and the second wiring pattern; and  
separating the plurality of display devices into individual display devices.

10. (New) A manufacturing method of a display device according to claim 9, wherein the display device includes a plurality of TFTs.
